

RACKING MEZZANINE FLOORS

Racking mezzanine floors are built by using pallet racking to support the floor.

This floor design has more obstructions under the floor area but can be designed to suit the specified area.

Racking can be extended through the mezzanine floor to create walkways between the racking and this allows the weight to be direct on the foundation.

Racking mezzanine floors are a lot more cost effective than Structural mezzanine floors.

Suitable applications:

- * To create multiple storage levels under mezzanine area with open area on top
- * To create multiple storage levels below and on top of mezzanine
- * Ideal for bulk document storage
- * To create partition type storage under mezzanine

This floor system carries lighter loads:

o 250 kg/m² – 500 kg/m²
